

LinkLoad: Mechanical Co-Founder Role

The Problem

Laundry today is a broken workflow. Washing and drying are two disconnected systems that require minimal human intervention at a high opportunity cost. Most attempts to fix this remove the need for manual transfer, but introduce tradeoffs that inhibit widespread adoption.

Our Solution

LinkLoad offers an automated laundry system that eliminates manual transfer through mechanical automation and a split-drum architecture. The system reimagines laundry as an autonomous, two-load flow, delivering the coveted single-touchpoint UX while preserving the performance of traditional setups. LinkLoad is not merely a product; it's a next-generation home and commercial appliance company building systems for an increasingly automated and time-constrained world.

Current Stage

The core architecture is legally protected, though there is still significant green field in how it gets built. Initial work has included interfacing with operators across multiple segments, which has narrowed the focus to segments where this problem is most acutely felt. We are now embarking on DV1, where the immediate goal is to build a system that demonstrates reliable transfer under realistic load conditions.

The Role

I'm looking for a hands-on co-founder with a product development background to own the product engineering, start prototyping today, and eventually hire/lead the engineering team. Specifically, you will:

- Design and iterate on motion systems (actuators, rotating assemblies, low-tolerance interfaces)
- Identify and solve failure modes (radial misalignment, jamming, wear-and-tear, etc.)
- Drive the system toward reliability/manufacturability (material selection, ID/EE/ME, etc.)
- Own the product engineering vertical as the company scales

The ideal candidate:

- Has 3-8+ years of mechanical design experience, preferably with motion systems
- Has experience building and iterating on physical prototypes (3D printing, machining, assembly)
- Is comfortable building fast and scrappy, and working pragmatically through ambiguities
- Is interested in building a long-term company, not just a project

If this resonates, send a note with your background to jarett@linkload.co and we can set up a time to talk.
